

ABSTRACT

An information search system enabling an information searcher to easily surely judge whether each piece of search target information searched is important to the searcher

5 himself or herself, is disclosed. The information search system implements a function of calculating, when searching for property information on a real estate property that satisfies a search condition specified by a certain user, a degree of fitness indicating how much each piece of property information
10 satisfies the search condition on the basis of a degree-of-fitness calculation function for that user, and a function of enabling each user to change a configuration of the degree-of-fitness calculation function for the user himself or herself.
